# Make local pickup dependable.

## One corridor first.
## ASYV ↔ Ntunga

Choose the plate. Confirm the meeting point.
Communicate clearly. Ride first. Pay afterwards.

**RWF 2.85m**
**conditional pilot envelope**

20 licensed drivers
100 active-adult target
90-day validation pilot

A working prototype demonstrates the process. It does not prove demand, safe operations or profit.

# The access problem matters. Local demand still needs proof.

## 17% rural
## 54% urban

Households within 20 minutes of a public transport stage. [S1]

## A real last-mile corridor

ASYV’s directions go via Ntunga, then about 9 km off the main road. [S2]

## What we do NOT know yet

Local no-show rates, true pickup times, paid demand and driver willingness to pay.

Research first: 30 adult passengers, 20 drivers, 5 budget holders and 30 observed pickup attempts.

# Beat the customer’s current solution, not an imaginary gap.

## Walk to the rank

Familiar, direct and no app.
Prove less search and waiting.

## Call a known driver

Existing trust and easy discussion.
Prove backup availability and useful records.

## Existing platforms

Metering, payment options and trip records already exist. [S5]
Do not claim these are unique.

Proposed edge: a locally supported driver roster, honest pickup coordination and assisted access.

# Canvas / customers, value and access

## WHO USES IT

Adult staff, visitors and nearby workers.
100 active customers is a target, not an existing audience.

## WHY THEY CHOOSE IT

Identify a plate, agree a meeting point, communicate and pay after the trip.
Prove reliability.

## HOW WE REACH THEM

Mobile web, rank demonstrations and authorized partner desks.
Assisted booking for non-smartphone users.

## HOW WE RETAIN THEM

Kinyarwanda-first onboarding, familiar drivers, clear support hours and useful trip records.

# Canvas / operations must make the promise real

## PARTNERS

Licensed local cooperative.
Prospective institutions.
RURA / privacy advice.
Compliant suppliers.

## ACTIVITIES

Verify drivers.
Coordinate pickups.
Support complaints.
Maintain secure records.
Reconcile fees weekly.

## RESOURCES

Existing prototype.
Borrowed devices / space.
Founder work in kind.
Part-time support.
Working capital.

No motorcycle purchases. No office lease. No claim that any partner has already signed.

# Canvas / earn from service, control the cash cost

## PROPOSED REVENUE

8% fee on completed app trips only.
RWF 75,000/month per institutional desk.
No cancelled-trip fee or passenger deposit.
Grants fund the pilot; they are not sales.

## LEAN COST MODEL

RWF 880,000 setup.
RWF 500,000/month at 20 drivers.
RWF 20/completed trip variable provision.
Founder labour disclosed separately.

Lower cost does not mean free: support, compliance, hosting and map usage are budgeted.

# One completed trip: where the money actually goes

**2,500**

RWF illustrative fare paid to driver

**200**

RWF platform fee proposed at 8%

**190**

RWF collected at 95% collection

**170**

RWF contribution after RWF 20 variable

**With two paying desks, base cash break-even is 2,059 trips/month: about 4 completed app trips per driver per operating day.**

# A capped experiment: RWF 2.85 million

| | |
|---|---|
| Setup | **880,000** |
| 3 months fixed support | **1,500,000** |
| Variable provision / 4,680 trips | **93,600** |
| 15% contingency | **371,040** |

## Calculated envelope: RWF 2,844,640

Release RWF 150,000 for discovery first. No fleet purchases or nationwide launch.

# Be honest: the base pilot is not yet profitable.

| Monthly case | Trips | Cash receipts | Cash operating result |
|---|---|---|---|
| Downside | 520 | 53,040 | -457,360 |
| Pilot month 3 | 1,560 | 446,400 | -84,800 |
| Expansion hypothesis | 6,240 | 1,560,600 | 392,360 |

No paying desks, lower fares or unpaid driver fees can break the model. Expansion is a testable hypothesis.

# Rwanda-specific conditions come before launch.

**FARES & FEES**

Confirm current RURA rules. Bargaining and a new platform fee are conditional, not assumed permitted.

**PEOPLE & DATA**

Licensed operators, verified insurance and helmets; adults-only pilot. Privacy registration and lawful hosting.

**SERVICE & TAX**

Defined support hours and escalation. Confirm invoicing, VAT and income-tax treatment. No held passenger deposits.

# 90-day go / change / stop gates

## 1 / DISCOVER

30 passengers, 20 drivers, 5 budget holders; observe 30 pickups. Is this problem painful enough?

## 2 / OPERATE

Permitted, supported trial: target ≥80% completion and 30% lower median wait versus measured baseline.

## 3 / GET PAID

10 drivers accept the permitted fee; 95% collection; two institutions sign and pay.

## 4 / EARN REPEAT USE

Target 30% repeat within 30 days. Protect driver take-home income. Stop if economics or safety fail.

# The ask: prove this corridor before expanding.

**Approve a conditional RWF 2.85m envelope.**
**Start with RWF 150,000 for discovery.**

We will measure reliable pickup, real repeat use, driver earnings and actual cash collection.
If the evidence does not support the model, we change it or stop.

Demonstration: customer request → driver agreement → 15-second simulated approach → pickup code → pay after.
